Title : Results of Comparative Investigation of Virus G₁ Isolated From Animals and Its Relation to Human Influenza Viruses.

Orig Pub : Bull. Acad. polon. sci., 1957, Cl. 2, 5, No. 3, 89-92

Abstract : A pneumotropic virus (G₁) which was pathogenic to white mice, hen embryos and agglutinized hen erythrocytes, was isolated from sick piglets. Electronoscopically, the virus has a globular form with a diameter of about 100 millimicrons. The isolated virus is akin in its antigenic structure to the Shoup pig's influenza virus and differs from human influenza virus types A and B. In experiments on mice it was possible to obtain an interference phenomenon between virus G₁ and influenza viruses type A and B under specific conditions. 1 electronoscopic photograph is attached. -- L. S. Segal'

1677. ANTIGENIC STRUCTURE OF L FORMS, TYPE 3A AND 3B, OF PROTEUS VULGARIS - Badania nad budową antygenową form L3A i 3B Proteus vulgaris - Lorkiewicz Z., Hulanicka E. and Weinrauder H. Zakt. Mikrobiol. Ogólnej Uniw. Marii Curie-Skłodowskiej, Lublin - ACTA MICROBIOL. POL. 1958, 6/4 (311-320) Tables 2

The antigenic structure of 3B L forms and stabilized 3A L forms of Proteus was studied by agglutination, absorption of agglutinins and precipitation reactions. In absorption of anti-H serum a difference in antigenic structure between 3B and 3A was shown. The somatic antigens of Proteus were more complete in 3B than in 3A..

2413. MECHANICAL RESPONSE OF THE FROG'S RECTUS TO POTASSIUM.
TWO PHASES OF THE KCl CONTRACTURE - Lorković H. Inst. for
Med. Res., Yugoslav Acad. of Scis and Arts, Zagreb - AMER. J. PHYSIOL.
1959, 196/3 (666-668) Graphs 3

The mechanical response of rectus abdominis muscles of Rana esculenta to potassium ions (5.6-23.5 mM in Ringer's solution) shows 2 distinct phases. The twitch fibre reaction, giving rise to the first phase of the response curve, does not last more than 1-2 min. It can be provoked with KCl concentrations of the order of 5-7 mM; its intensity is not much influenced by increasing KCl concentrations higher than 10 mM; its intensity is reduced by high CaCl₂ concentrations, and also by shortening the length of the interval between 2 exposures of the muscle to increased KCl concentrations. The slow fibre reaction, giving rise to the second phase, is a true tonic contracture which can be obtained only with concentrations of KCl larger than 10 mM. Changes in the CaCl₂ concentration and in the length of the interval do not affect it so much as the first phase.

Abstract: *sicae*, *P. rapae*, *Gonepteryx rhamni*, *Erebia stierius* and *E. styx*). Change in these protuberances takes place more often than the change in the uncus, thereby indicating that they are less important for the insects. Thus, the side protuberances in *E. tyndarus* and its subspecies *E. (t) cassiooides* are very variable and do not permit to distinguish the subspecies, while the small but almost constant difference in the subuncus length is a good diagnostic sign. The large variety of the external sex organs in the insect males is explained by changes in the less important parts, which had no effect on the individual's life and were therefore less subjected to the influence of natural selection than the

Title : The Analysis of the Population of Two New Stenochore Erebia Varieties from Croatia.

Orig Pub : Biol. glasn. Hrvatsko prirodosl. drustvo, 1955 (1956),
No 8, 53-76.

Abstract : A new variety of the East Alps species of E. Stirius Godt. described as kleki ssp n. was found recently in West Croatia on the top of the mountain Klek. Studies have shown that E. stirius kleki is natural in this mountain only and is nowhere to be found in Croatia. The new variety differs from other close subspecies by a number of features. Breeding experiments have established that these features were hereditary. E. stirius kleki lived on a section of a stony slope (400-500 m in length and 50 m in height) at a

Card 1/2

, YUGOSLAVIA/General and Specialized Zoology - Insects.

P.

Abs Jour : Ref Zhur - Biol., No 9, 1958, 40039

1100-1150 m height. The whole population consisted of 120 individuals. Because of the small number of individuals, changes in this variety were slight. A new variety *E. gorge vagana* ssp.n. was found on two tops of the Velebit mountains (on the stony north-east slope 4 km in length and 1600-1700 m in height). The changes in this variety are smaller than those in the large populations of *E. gorge* in the Julian Alps and in Bosnia-Herzegovina. As both species described above populate the highest regions of the mountains 150 m below the top, one may conclude that no considerable change in temperature has taken place during the post-glacial period; otherwise these varieties on the low mountains of Croatia would have died long ago. -- G.A. Mazokhin.

USSR/General and Special Zoology. Insects

Abstr Jour : Ref Zhur - Biol., No 6, 1958, No 25767

Author : Il'inskii A.I., Lornes K.F.

Inst : All-Union sc.-research Institute of Forestry.

Title : Chemicl and Agrotechnical Means of Controlling Pestiferous
Soil Insects. (Khimicheskiye i agrotekhnicheskiye mery bor'by
s vrodnymi pochvennymi nesokomymi.)

Orig Pub : Sb. rabot po lesn. kh-vu, Vses. n.-i. in-t lesovedstva i
mekhanizma lesnogo kh-vr, 1956, vyp. 33, 86-91.

Abstract : Loring fellow the forest sand scils for two years (seven
treatments) decreased the numbers of May beetle larvae only
by 59%, but in combination with an HCCH treatment in 20 and 40
kg per hectare it decreased their numbers by 79% and 90%.
On the average 97% of eastern May beetles and 90% of their
one-year larvae perished when 8925 hectares were dusted with
a 12% dust of HCCH (16 kg per hectare). The dusting of the
seedling roots of the pine tree with a HC dust or the wetting
with an HC suspension (0.25 per seedling), the powdering of

the planting fissures (0.25 g) and the prosowing powdering of the ears (0.1-0.2g/kg) greatly decreased the damage done to the plants by the beetle larvae; but the method of employing HC along the planting furrow was ineffective. Partial (at planting into terraces and furrows) and especially unbroken priming of the soil with HC secured the highest conservation of plants and cleared the soil from the beetle larvae; it was sufficient to carry out the priming of the soil once in 4-5 years.

TITLE: About the "Static Diagrams of Stray Currents" of Engineer I. Yu. Baron
(O "staticeskikh diagrammakh bluzhdayushchikh tokov" inzh. I. Yu. Barona)

PERIODICAL: Tr. In-ta energ. AN GruzSSR, 1957, Vol 11, pp 123-126

ABSTRACT: The author challenges the correctness of I. Yu. Baron's method for determining the effect of streetcar stray currents (see "Elektrichestvo" journal, Nr 9, 1953). Major objections are raised against assuming a chance circuit instead of the actual circuit and against replacing the equivalent distributed load by a load concentrated at an arbitrary point. I. Yu. Baron's experimental conclusions are refuted on the grounds that it is impossible to make accurate measurement of a voltage drop of 25 and less microvolts by the instruments he used. I. Yu. Baron's contentions about detection of the influence of streetcar stray currents upon the underground structures are considered erroneous, and his methods entirely unacceptable.

18(7)16(7) PHASE I BOOK EXPLOITATION

Zashchita podzemnykh metallicheskikh struktur ot korrozii! (Protection of underground metal structures from corrosion). (Protective Manual) Riga, Izd-vo N-va "Zinatne", no. 2000, 61,000 copies printed. 1959. 745 p. Errata slip inserted.

Ed.: R.I. Ayvazov, Ed. of Publishing House: V.O. Akhava. Tech. Ed.: S. S. Petrovskaya.

PURPOSE: This collection of articles is intended as a manual on corrosion protection of underground metal structures.

CONTENTS: The book is divided into four parts. The first part gives information on the characteristics of underground metal structures and sources of stray currents. The second part deals with the theory of soil corrosion of metals and the theory of corrosion of metals by stray currents. The third part deals with the problems of combating leakage from sources of stray currents, methods and devices for investigating corrosion. The fourth part contains plans for planning corrosion prevention. It contains plain measures for preventing corrosion of underground metal structures and gives the basic operating principles of equipment required. No permeabilities are mentioned.
